Published 10 03 2025, 17:00

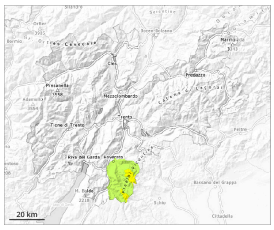
Danger Level 2 - Moderate

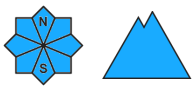


Tendency: Constant avalanche danger
on Wednesday 12 03 2025

Wind slab

Snowpack stability: poor
Frequency: some
Avalanche size: medium

Wet snow



Snowpack stability: poor
Frequency: few
Avalanche size: small

New snow and wind slabs represent the main danger. Individual moist and wet avalanches are possible.

The avalanche danger will increase but remain within the current danger level.
The wind slabs must be evaluated with care and prudence in all aspects above the tree line. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls, and behind abrupt changes in the terrain.
As a consequence of warming during the day individual small to medium-sized moist and wet avalanches are possible.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

In particular in the Vallarsa up to 40 cm of snow has fallen above approximately 1800 m.
The wind has transported the new snow.

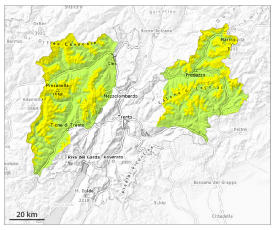
Danger Level 2 - Moderate



Treeline

Tendency: Constant avalanche danger
on Wednesday 12 03 2025

Wind slab

Treeline

Snowpack stability: poor
Frequency: some
Avalanche size: medium

Wet snow

Snowpack stability: poor
Frequency: few
Avalanche size: small

New snow and wind slabs represent the main danger.
Individual mostly small moist and wet avalanches are possible.

The wind slabs must be evaluated with care and prudence in all aspects above the tree line. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls, and behind abrupt changes in the terrain.
As a consequence of warming during the day individual small to medium-sized moist and wet avalanches are possible.
Wind-loaded slopes where weaknesses exist in the old snowpack are unfavourable. These avalanche prone locations are to be found in particular on very steep shady slopes above approximately 2400 m.
Avalanches can reach medium size.

Snowpack

Danger patterns dp.6: cold, loose snow and wind | dp.1: deep persistent weak layer

Over a wide area up to 20 cm of snow has fallen above approximately 1700 m. The wind has transported the new snow. The more recent wind slabs are lying on soft layers on shady slopes at elevated altitudes.
Faceted weak layers exist in the bottom section of the snowpack on west, north and east facing slopes.
Only a small amount of snow is lying for the time of year.

Tendency

The avalanche danger will persist.

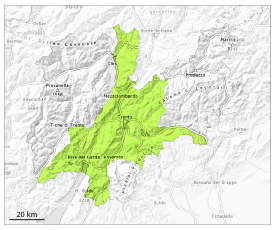
Danger Level 1 - Low



Tendency: Constant avalanche danger
on Wednesday 12 03 2025

Wind slab

Treeline

Snowpack stability: poor
Frequency: few
Avalanche size: small

Wet snow

Snowpack stability: poor
Frequency: few
Avalanche size: small

New snow and wind slabs represent the main danger. Individual moist and wet avalanches are possible.

The avalanche danger will increase but remain within the current danger level.
The wind slabs must be evaluated with care and prudence in all aspects above the tree line. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls, and behind abrupt changes in the terrain.
As a consequence of warming during the day individual small to medium-sized moist and wet avalanches are possible.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

Down to 1600 m snow has fallen over a wide area. The wind has transported the new snow.
Only a small amount of snow is lying for the time of year.

Tendency

The avalanche danger is close to the boundary with danger level 1 (low).
The danger of wet avalanches will decrease gradually.
